METHOD FOR EXECUTING AN OBJECT IN A WIRELESS INTERNET ACCESS TERMINAL

Abstract of the Disclosure

The present invention relates to a method for executing an object in a wireless internet access terminal. The present invention includes steps of interpreting data inputted through the internet and displaying the inputted data; focusing any one of plural objects displayed on a screen and each linked to predetermined resource access location information; and selecting and executing any one of various execution items of the focused object according to an input state of a single button, so that it has an effect in that a user uses internet services conveniently through a wireless terminal since a user determines an execution item of an object with ease without pressing buttons several times with inconvenience by providing different execution items of an object according to input states of a single button in case that there exist plural execution items of one object.
